

How to export your collection for use in my programs

There are a few different options

Manual export

- Select *File / Export Profile Database* from the menu
- Click *Accept* at the usage policy
- Select *Single file* and name it something with an extension of *.xml*
- Select a suitable directory where to save the export file
- Click *Next*
- Under *Export selection* you probably want to select *All* or *Owned*
- Select everything under *Optional Export Data*
- Click *Export*

Using a command file

If you expect to export your collection more than just a few times, a command file will make that a whole lot simpler. A command file is a text file with commands for DVD Profiler. Example:

```
CollectionType Owned  
ClearAllFilters  
ExportXMLFiltered E:\DvdProfilerExport\Owned.xml
```

This is my command file for exporting my owned collection. Obviously you should change the third line to a filename that suits you. Put this in a text file and save it with a suitable name, for example `ExportOwned.txt`.

To export using the command file, just select *File / Run Command File* from the menu and select your command file. The export will run without any more interaction.

You can read more about command files [here](#).

Using DvdpScheduler

If you keep your PC running over night, you can use my program [DvdpScheduler](#) to schedule an automatic export of your collection. You can also use it for one-click exports on demand.

For more info, download it and read the help file.
